Season: Week 22-43

Celery
Season: Week 23-49

Iceberg lettuce
Season: Week 20-44

Onion, red
Season: All year

Onion, yellow
Season: All year

Facts about Axel Månsson A/S
Axel Månsson bought his farm in 1976. Cultivated area: 1,400 ha, of which approx. 1,000 ha is organic. Alongside the vegetable production is an organic egg production based on 201,000 egglayers.

Specialized in fresh vegetables

The company Axel Månsson A/S is one of the most innovative producers of organic vegetables and organic eggs in Scandinavia. Focusing on the soil, plants and animal welfare, Axel Månsson has been producing vegetables and eggs for more than 40 years. Axel Månsson has an eye for tomorrow’s needs, and the company is constantly evolving. The range is expanding in line with product demand.

Product development

The development of a new product starts in a development and demonstration area where many new species and varieties are tested and produced each year. Samples and smaller lots are shipped to customers for testing, and we learn whether it’s possible to produce the relevant product organically, on Brande’s light soil. New emerging organic products include: Fresh herbs and edible flowers, new types of cabbages and new specialty lettuces, as well as more exotic species.

Convenience products

Convenience products, such as whole peeled onions, have been part of the range for many years, and this segment is still being developed – first and foremost as peeled onions diced or cut into rings. All products come in a variety of packages and in both organic and conventional variants.

Openness

The farm is known for being open to the public. Guided tours, lectures and workshops etc. are available upon request. A former hen house is converted into a well-stocked organic farm shop, and an organic farm café is on its way.

Sustainable production

Axel Månsson has a vision to become self-sufficient in nutrients in order to close the organic cycle. An organic biogas plant converts different biomasses to green gas, which can heat up to 4,000 households. The degassed biomass is used as valuable fertilizer for the vegetables. The latest technology is used in e.g. weed control and packaging. Sustainability is in focus in all aspects of the production. Monitoring and analysis is continuously used in the production to ensure efficient utilization of the resources supplied, as well as full traceability.
